Terminal C/G reconstruction · 626 windows · 7 genes · *** p < 0.001 (paired t-test, two-sided)
Four-baseline comparison vs terminal zone width
Gap largest at T_END = 3; it narrows as wider zones mix in background C/G positions where DAM and MLM perform alike.
Nucleotide recovery rate (mean per window)
Terminal zone width (nt from each end)
Random (theoretical)
Zero-shot DNABERT-2
Random (observed)
MLM fine-tuning
DAM (proposed)
DAM advantage over MLM
DAM − MLM recovery (Δ)
Windows (n)
